

INGREDIENTS - ALK Body Lotion

Aqua: Diluent

Canola Oil: Non-tacky oil that are ideal for skin care applications. It has a high proportion of unsaturated fatty acids.

Butyrospermum Parkii (Shea) Butter: Shea Butter has smoothing properties and preserves the innate moisture of the skin. It is used to improve formulation texture. It is a semi-solid, butter-like vegetable fat, and the concentration of natural vitamins and fatty acids in shea butter makes it incredibly nourishing and moisturizing. It prevents dryness, and results in a softened skin.

Glycerin: In cosmetic products glycerin is used as a moisturizing agent due to its water-attracting properties. It makes skin feel smooth. Our glycerin is derived from vegetable fats and oils.

Borago Officinalis Seed Oil: Oil extracted from the seeds of the plant Borago officinalis. Provides a high level of the fatty acid gamma-linoleic acid (GLA) that is found in skin.

Cetearyl Alcohol: A plant-based emulsion stabilizer and viscosity increasing agent that supports the main emulsion system. Has a moisturizing effect.

Ceteareth-12: Vegetable emulsifier from coconut/palm kernel oils.

Ceteareth-20: Vegetable emulsifier from coconut/palm kernel oils.

Phenoxyethanol: Preservative that is considered one of the least sensitizing for use in cosmetic formulations.

Benzoic acid: Weak organic acid that is part of a mild preservative system consisting of: Phenoxyethanol, Dehydroacetic Acid and Benzoic Acid.

Dehydroacetic acid: Weak organic acid that is part of a mild preservative system consisting of: Phenoxyethanol, Dehydroacetic Acid and Benzoic Acid.

Carbomer: Emulsion stabilizer and viscosity increasing agent.

Tocopheryl Acetate (Vitamin E): A natural antioxidant that protects the product against oxidation. Derived from vegetable oils.

Saccharide isomerate: Carbohydrate complex that resembles a carbohydrate complex found in human stratum corneum. Good water-binding agent and emollient for the skin, and particularly helpful for dry skin.

Citric acid: Citric acid is a weak organic acid that is used in low concentrations to regulate/stabilize the pH-value.

Sodium citrate: Sodium citrate is the sodium salt of citric acid. It is used in low concentrations to regulate/stabilize the pH-value.

Sodium Hydroxide (lye): Highly alkaline ingredient used in small amounts in formulations to regulate/stabilize the pH.
